

# Cryptographic Protocols

# What we covered

- We can **encrypt** and **decrypt** messages (we looked at RSA)
- We can **sign** and **verify** messages by reversing the order of those operations
  - e.g.  $\text{Decrypt}(\text{priv\_key}, \text{ciphertext}) == \text{Sign}(\text{message})$  and  $\text{Encrypt}(\text{pub\_key}, \text{message}) == \text{Verify}(\text{signature})$
- We can generate short, fixed-length representations of input data by **hashing**
- We can **exchange keys** securely (we looked at DH)

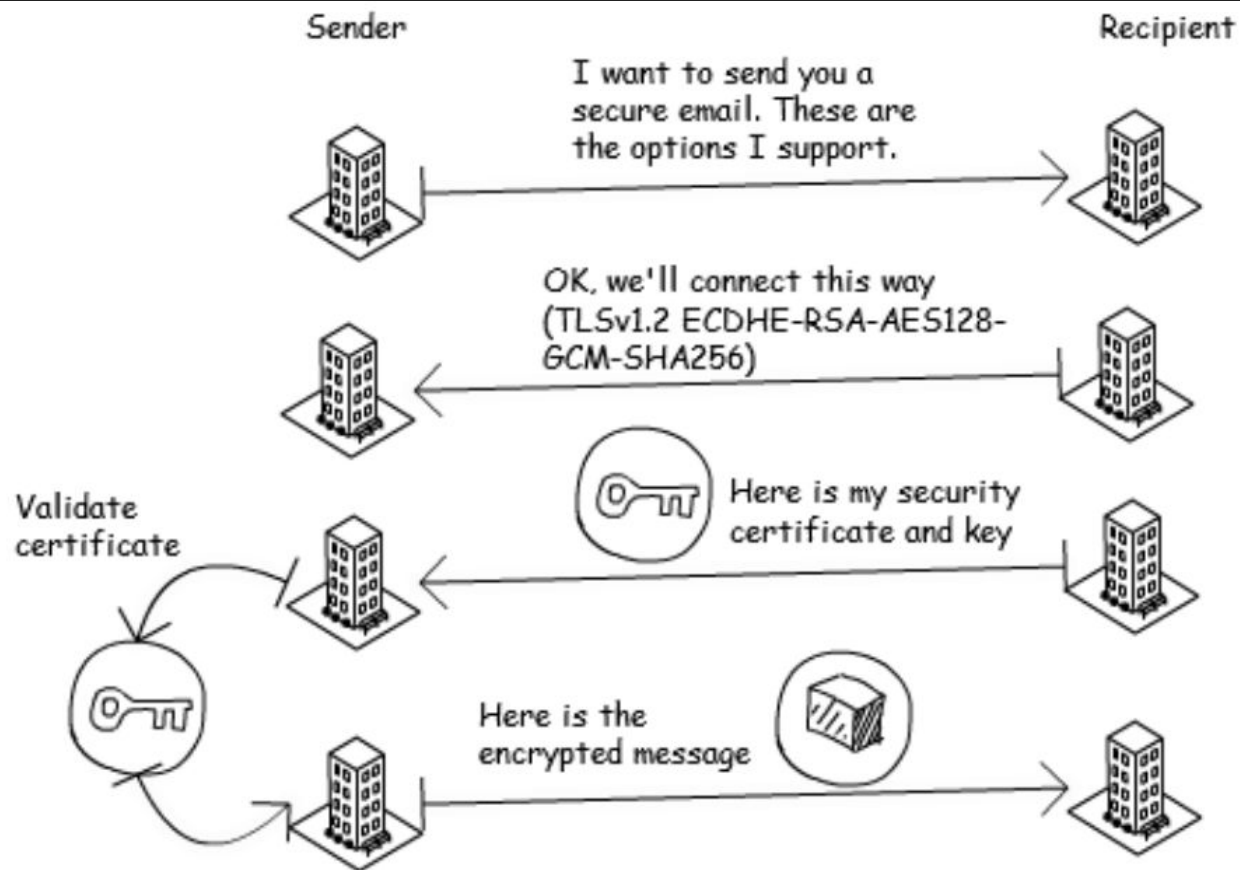

# TLS

- TLS is the cryptography that underpins HTTPS connections
  - Provides **privacy**, **authentication**, and **integrity**
- **Cipher-suites** let us choose which cryptographic primitives we want to use for signatures, encryption, and key distribution
- High-level overview: choose a cipher-suite, **exchange keys**, **verify each other**, and then communicate with **authenticated encrypted data**.

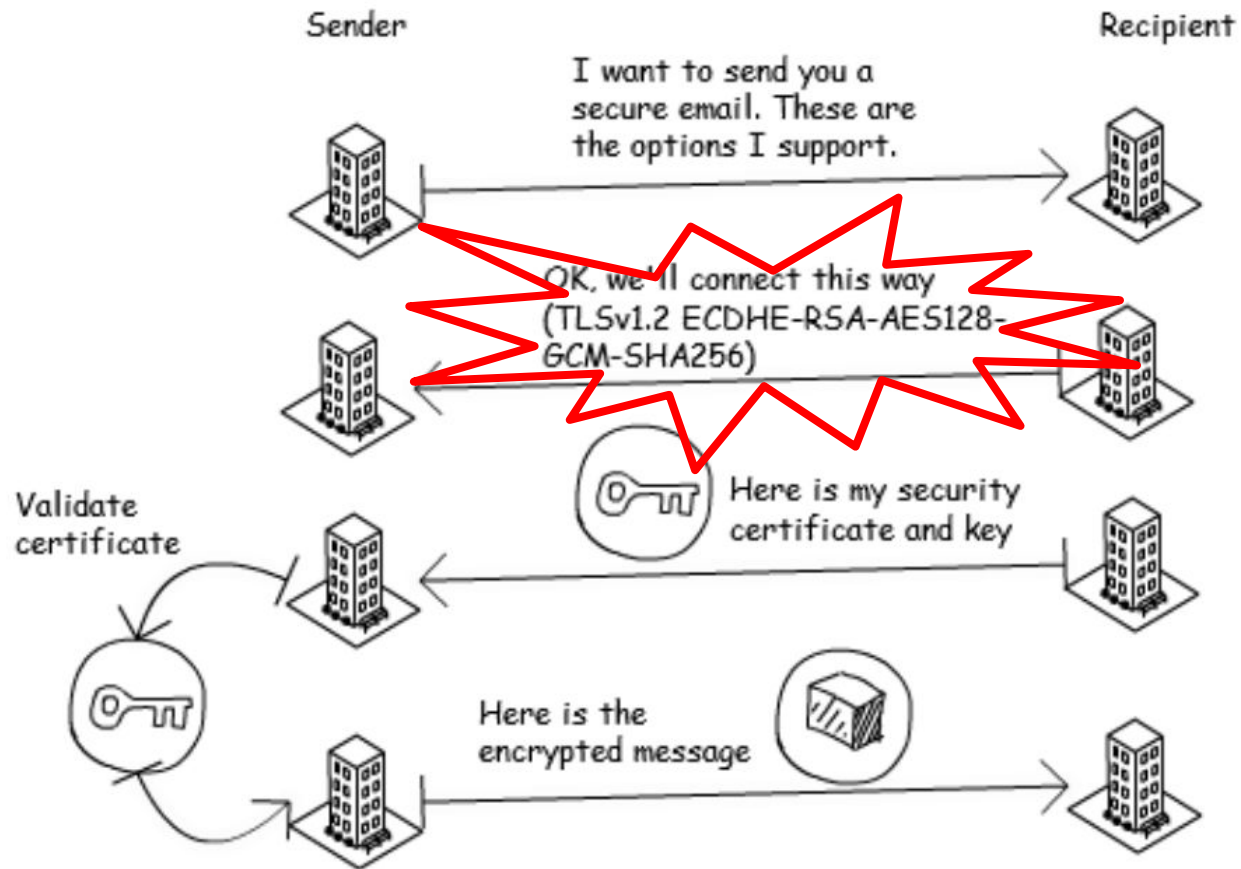

TLS\_**DHE**\_**RSA**\_WITH\_**AES**\_256\_**CBC**\_SHA256

# TLS

\* This is mostly right, but not exactly

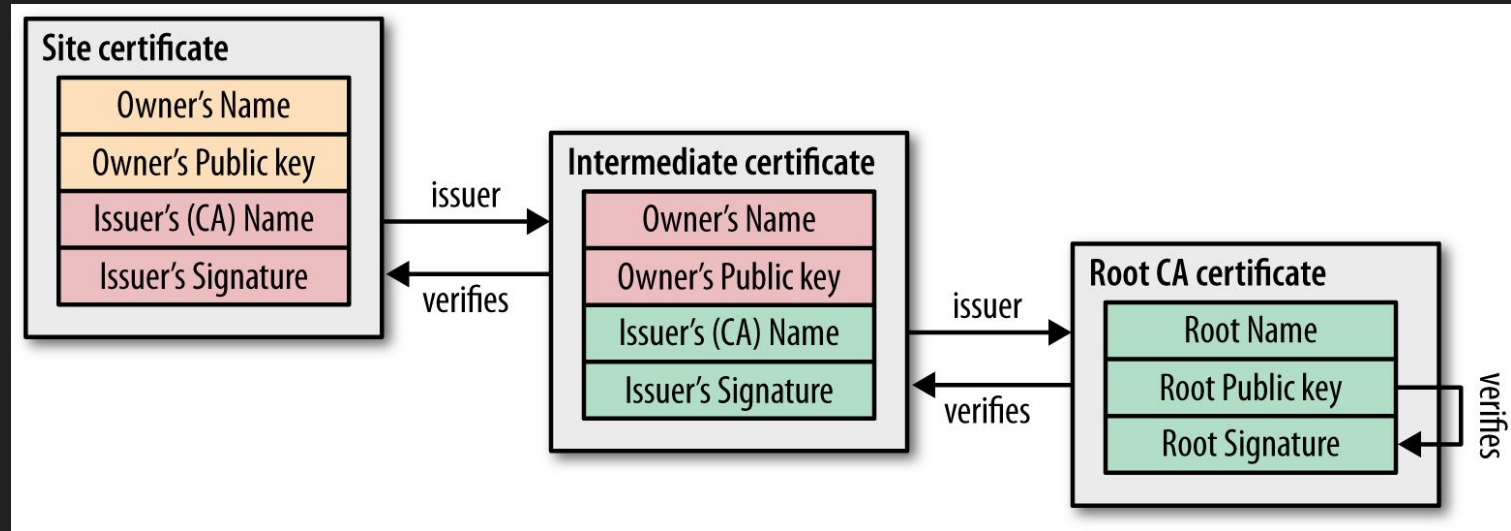

# Cipher-suite

\* This is mostly right, but not exactly

# Certificates and Certificate Authorities

- Servers are verified with **certificates**, which are signed pieces of data containing the name of the domain (e.g. google.com) and some company info
- **Certificates** are signed by **certificate authorities** in a **trust chain**

# Certificates and Certificate Authorities

- CAs are part of the **Public Key Infrastructure**, which is a response to the key-distribution problem
  - We want to distribute public keys and know that they belong to who they claim they do
- Each computer client saves a list of CA certificates on its location machine
- You can see your own CA certificates on your computer!

# Other Protocols

- Coin flipping: should Alice and Bob go to the opera or a soccer match?
- Interactive proofs: can Alice convince Bob something is true?
- Yao's millionaires' problem: does Alice or Bob make more money?
- Socialist millionaire's problem: do Alice and Bob have the same salary?
- Privacy-preserving computational geometry
  - Does Alice's point lie inside Bob's polygon?
  - Do Alice and Bob's polygons intersect?

# Coin Flipping IRL

**Tails!**

# Coin Flipping in Cyberspace

**Tails!**

**Internet**

**Nope, it  
was  
heads!**

# Coin Flipping via Commitment

Have Alice commit to her call without revealing it.

Let  $H$  be a secure hash function

$H(\text{Tails}) =$   
92135...

92135...

I called  
Tails

=

$H(\text{Tails}) =$   
92135...

It was  
Tails

# Coin Flipping via Commitment

Have Alice commit to her call without revealing it.

Let  $H$  be a secure hash function

$H(\text{Tails}) =$   
92135...

92135...

I called  
Heads

$\neq$

$H(\text{Heads})$   
= eb93c...

No you  
cheated

It was  
Heads

# Coin Flipping via Commitment

But Bob can search the message space to find Alice's call

$H(\text{Tails}) =$   
92135...

92135...

I called  
Tails

$H(\text{Heads}) =$   
eb93c...  
 $H(\text{Tails}) =$   
92135...

It was  
Heads

# Coin Flipping via Commitment

Artificially increase the message space with *nonces*

$H(d61cbTails)$   
= 69f05...

It was  
Tails

69f05...

$H(d61cbTails)$   
= 69f05...

I called Tails with  
randomness  
d61cb

# Password Hashing

User	Salt	Hash
Alice	1234	bca288ee
Benji	5678	0ba96592
Carol	9999	406da7cd

I'm Alice, and my  
password is hunter2

$H(1234\text{hunter}2)$   
= bca288ee

# Challenge-Response Authentication

Hey it's Alice

$\text{Enc}(\text{hunter2}, 5387)$   
 $= 8425$

Okay it's  
8425

Prove it: encrypt  
5387 with our  
secret key

$\text{Dec}(\text{hunter2}, 8425)$   
 $= 5387$

I knew it was  
you the  
whole time :)

# Zero-Knowledge Proofs

# Zero-Knowledge Proofs: 3-Colorability

# Zero-Knowledge Proofs: 3-Colorability

# Zero-Knowledge Proofs: 3-Colorability

# Zero-Knowledge Proofs: 3-Colorability

# Multi-party Protocols

- Secret sharing: distribute a secret among Alice and her friends
- Electronic voting
- Secure computation
  - Allow distrustful participants to compute a function on their secret inputs
- Decentralized digital currency: let Alice pay her ransomware hackers

# Shamir's Secret Sharing

Divide the secret  $S$  into  $n$  parts, but only need any  $k$  of  $n$

Generate a random polynomial with degree  $k-1$ !

*My secret is "123", and I  
want  $n=3$ ,  $k=2$*

$$y = 123 + 95x + 54x^2 \bmod 17729$$

*(1, 272) (2, 529) (3, 894)*

# Shamir's Secret Sharing

$(1, 272), p=17729$

$(3, 894), p=17729$

$(2, 529), p=17729$

- Any 2 of 3 are sufficient to construct the original polynomial, and thus Alice's secret value!

# Electronic Voting: Goals

- Keep the vote anonymous
- Verify the vote totals
- Allow voters to verify that their votes were counted as cast
- Only authorized parties can vote
- No one votes more than one
- Coercion resistance: ensure Alice can't prove who she voted for

# Electronic Voting via Mixnets

# Electronic Voting via Mixnets: Encryption

$$x_i = \text{Enc}(\text{Pub}_A, \text{Enc}(\text{Pub}_B, \text{Enc}(\text{Pub}_C, v_i)))$$

# Electronic Voting via Mixnets: Encryption with nonce

$$x_i = \text{Enc}(\text{Pub}_A, \text{Enc}(\text{Pub}_B, \text{Enc}(\text{Pub}_C, r_i \parallel v_i)))$$

# Homework

- Complete exercises 1 – 4 of Cryptopals Set 1 (<http://www.cryptopals.com/sets/1>)
  - These are easy challenges that lead to detecting and breaking a simple shift cipher
- Complete additional exercises for extra credit (e.g. exercises 5 and 6)
  - Feel free to jump ahead to other problem sets

## Tips

- **Don't hesitate to ask questions! (Slack, email, etc)**

# Homework grading

- Send an email with the answer to exercise 4 to [cm7bv@virginia.edu](mailto:cm7bv@virginia.edu) with the subject “MST Assignment 7 - <YOUR\_UVA\_ID>”
  - eg: “MST Assignment 7 - cm7bv”
- Include a brief (1-paragraph) description of what you did and how it went
